

1 · Opening the app

cold start to Home

Home
today at a glance

Check in
biometric punch

Modules
12 native lists

Messages
with unread badge

Portal
the web HRMS

All five tabs stay loaded from the moment you sign in. Switching between them shows and hides — nothing reloads, so the portal keeps its scroll position and Messages can count unread before you have looked.

**APP OPENED**

1

**The stored session is read**
from the phone's secure store, not from ordinary app storage

❓ **Is that session still valid?**

YES
Opens straight on Home — no sign-in every morning.

NO
Sign-in screen: work email and password.

2

**Signing in**
email + password → the API returns a session token, kept in the secure store

3

**Forgot the password?**
a reset link is emailed through the company's own SMTP account

**HOME TAB, SIGNED IN**

2 · Enrolling the phone

once per person, per handset

1

**The phone is checked first**
sensor present · fingerprint or face enrolled · a device passcode set

2

**A key pair is created on the handset**
ed25519, generated on the device — never sent, never derived from a password

3

**The private half goes into the OS keystore**
behind the phone's own biometric gate, this device only; nothing in the app can read it without you

4

**Only the public half reaches the server**
so the server holds nothing secret and nothing biometric

**THIS PHONE CAN NOW CHECK YOU IN**

**One phone, one person** each account gets its own key slot; enrolling a second person does not overwrite the first

3 · Check in and check out

what happens on one tap

**CHECK IN TAB · TAP CHECK IN**

1

**A one-time challenge is fetched**
so a signature captured once cannot be replayed tomorrow

2

**The phone raises its own biometric prompt**
reading the private key is what triggers it — the operating system enforces this, not the app

❓ **Did the fingerprint or face pass?**

YES
The challenge is signed. Only now does anything else happen.

NO
Nothing is recorded. No camera, no location, no request.

3

**Camera and location permission are asked**
asked at this point and not before, so nobody grants them for a check that already failed

4

**The verify screen opens**
a selfie, and the login place — GPS resolved to a street and district you can read

5

**Confirm sends signature, photo and place**
the biometric itself never leaves the phone; only the signature does

6

**The server checks the signature**
against the public key stored at enrolment, then writes the attendance row

**CHECKED IN — THE SCREEN SAYS WHAT WAS KEPT**

❓ **The selfie and the place are optional**
the biometric is not

- Decline the camera or location and the punch is still recorded — the reply says which of the two was kept.
- Decline the biometric and nothing is recorded at all.
- That is the whole design: the check the server can verify is required; the two it cannot are evidence, not proof.

Home — where people land

it routes, it does not own

**What Home shows**
the handful of things people opened the app to do

- Whether you are checked in, and since when
- Leave waiting on you, or waiting on someone else
- Tasks still open, and the latest announcement

**Tapping anything on Home opens the real screen** "Payslips"
lands on payslips — never on a dashboard copy of it

4 · Working a module

Modules tab

**MODULES TAB**

1

**A grid of the twelve modules**
a module your role has no use for is not drawn at all

2

**Open one — the list loads**
the same read endpoint the web portal uses, so there is no second set of rules to keep in step

3

**The rows you get are already yours**
an employee's leave list holds their own, HR's holds everyone's — same screen, same query

4

**Act on it**
Apply for leave · Approve or reject · move a task along · read a payslip · open a letter

❓ **Does the database permit that action?**

YES
It is written, and the list re-reads to show it.

NO
"Not done", with the database's own reason on screen.

**RECORDED, AND VISIBLE ON THE WEB AT THE SAME INSTANT**

5 · The rest of the HRMS

Portal tab

**It opens already signed in**
the session is handed across

- The token from the native sign-in is written into the page before its first line of code runs.
- Nobody is asked to sign in twice.
- Light or dark follows the app, not the browser.

**What lives there**
not worth rebuilding for a phone

- Payroll runs and salary structures
- Recruitment, company bank, settings
- The seven company reports
- Forty screens that already work

6 · What the app does quietly

without being asked

**Says it is open**
presence

- A short beat while the app is in the foreground, so colleagues see who is reachable.
- There is no "going offline" message — the server keeps the last time it heard, so a flat battery, a tunnel and a closed app all resolve correctly.

**Keeps the badge honest**
messages

- Messages loads at launch rather than on first open, so the unread count is right before you look at it.
- Signing in as somebody else starts a clean thread list.

**Fails safely**
session and back button

- A session that has expired signs you out cleanly wherever you were, rather than showing an error.
- Android back closes what is open, then returns to Home, then leaves the app — never straight out from three levels in.

**One rule underneath all of it** the screen hides what your role cannot use; the database is what actually refuses it
