

WHO	 1 · Set up the company once per tenant	 2 · Bring a person in hire to first day	 3 · Every working day the operating loop	 4 · Requests & approvals as they arise	 5 · Month end payroll and reporting	 6 · Change and exit role change to last day
 Platform Super Admin <i>Whhoohh Path</i>	■ Create the tenant company ■ Set status: trial → active ■ Choose the subscription plan ■ Enable the modules that plan includes	—	—	—	■ Review platform-wide usage	■ Suspend or close a tenant ■ Enter support mode — time-boxed, and logged
 Founder · Company Admin <i>owns the tenant</i>	■ Company profile, logo and letterhead ■ Departments, designations, leave types ■ SMTP account for company email ■ Enter the company bank account	■ Approve the hire ■ Verify the bank account — a different person from whoever entered it	—	■ Decide leave for anyone in the company ■ Resolve anything escalated	■ Approve the payroll run ■ Read the six company reports	■ Approve the exit ■ Sign off the final settlement
 HR Admin <i>runs the people process</i>	■ Load holidays into the calendar ■ Publish the policy handbook ■ Set opening leave entitlements	■ Move the candidate through interview ■ Create the employee and their login ■ Set the role and reporting manager ■ Set the salary structure ■ Issue the offer and joining letters ■ Assign the laptop and other assets	■ Correct attendance exceptions ■ Answer people queries ■ Post announcements	■ Decide leave for anyone ■ Amend a leave balance where it is wrong	■ Run payroll and issue payslips ■ Run the six reports	■ Set status on_notice, then exited ■ Issue relieving and experience letters ■ Take the assets back
 Project Manager · Team Lead <i>runs the work</i>	—	■ Take the new joiner onto the team ■ Assign their first tasks	■ Move the board along ■ See their team's attendance and presence	■ Decide leave for their own reports	■ Confirm what was completed in the period	■ Hand the work over ■ Reassign open tasks
 Employee <i>everyone has this baseline</i>	—	■ Sign in for the first time ■ Enrol the phone for biometric check-in ■ Complete their own profile	■ Check in and check out ■ Work their tasks ■ Read announcements and policies	■ Apply for leave ■ Read the decision and its reason	■ Read the payslip	■ Return the assets ■ Download the experience letter
 The system <i>automatic, no one triggers it</i>	■ Scope every row by company_id ■ Gate each module on the subscription	■ Generate the employee code ■ Create the login and email the credentials ■ Open the leave balances for the year	■ Verify the punch signature against the enrolled key ■ Record presence while the app is open	■ Check the balance before accepting a request ■ Email the decision to the employee	■ Compute gross and net from the salary structure ■ Email each payslip	■ Revoke the session ■ Keep the audit log — append-only

 What holds true in every phase *the six rules the whole workflow rests on*

Holds at every step	What it means in practice
Tenant before role	Every read is scoped by company_id before the role is consulted. A role widens access inside a tenant; it never reaches across one.
Two gates, not one	A module appears only if the company's subscription includes it AND the person's role permits it. Turning a plan off removes the module from everyone at once.
The database decides	Screens hide what a role cannot use so nobody is offered a dead end — but every write is a database function that re-checks the caller, and its refusal is what appears on screen.
Separation of duty	Entering a bank account and verifying it are different rights, held by different roles, so no one person can do both.
Nothing is retyped	A payslip is computed from the salary structure; a letter is generated from the employee record; a report is an aggregate the database builds. None of the three is a form somebody fills in.
Everything is logged	Security events and record changes are written to an append-only audit log that only HR can read, and that no role can edit.

A · Tenant onboarding

STARTS WHEN *a company signs up*

1. The platform creates the company. Status starts at trial.
2. A plan is chosen, and the modules it includes are switched on.
3. Onboarding moves new → setup_in_progress → configuration → ready → active.
4. The founder's own login is created first, so somebody can sign in.
5. The founder fills in the profile, branding, departments, designations and leave types.
6. SMTP is configured, and tested from inside the product before anything is sent.

ENDS WITH an active tenant whose every row is already scoped to it

B · Recruitment to joining

STARTS WHEN *a candidate applies*

1. The candidate is recorded: applied.
2. An interview is scheduled — interview_scheduled — and its outcome recorded.
3. Pass or fail advances the candidate automatically; there is no second place to update.
4. Offered, then joined.
5. HR creates the employee and the login in one operation, and the employee code is generated.
6. Role, reporting manager, salary structure and opening leave balances are set.
7. The offer and joining letters are issued and reach the person by email.

ENDS WITH an employee who can sign in on day one and see their own record

C · The attendance day

STARTS WHEN *the employee taps Check In*

1. The server issues a one-time challenge.
2. Reading the private key raises the phone's own biometric prompt.
3. The challenge is signed on the handset. Nothing else happens until it passes.
4. Camera and location are asked for — only now.
5. The selfie and the login place are captured and confirmed.
6. The server verifies the signature against the enrolled public key and writes the row.
7. Check-out repeats it, and the day is closed.

ENDS WITH an attendance record HR can rely on, and the employee can see

D · The leave cycle

STARTS WHEN *the employee applies*

1. Type, dates and an optional reason are submitted.
2. The balance and the date order are checked as it is submitted, not afterwards.
3. The request sits pending, and is visible to the employee and to whoever may decide.
4. A manager decides for their own reports; HR and the founder decide for anyone.
5. A rejection must carry a written reason — the employee reads it in the same row.
6. The balance is adjusted in the same transaction as the decision.
7. The decision is emailed.

ENDS WITH an approved or rejected request, a corrected balance, and no chasing

E · Work and delivery

STARTS WHEN *a project is opened*

1. The project is created and members are added.
2. Tasks are assigned, with dates, priority and a checklist.
3. The assignee moves the task along and reports how far it has got.
4. Permission is per field: anyone on it may move it, only a manager may re-scope it, only the assignee may report a percentage.
5. Checklist progress and task progress stay in step automatically.
6. Managers read the team's position through the reporting view.

ENDS WITH a board that reflects the work, and a report that needs no chasing

F · Month end and payroll

STARTS WHEN *the period closes*

1. Attendance for the month is settled and exceptions corrected.
2. Payroll is computed from each person's salary structure — not typed in.
3. Payslips are generated, one by one or for everyone at once.
4. The founder or accounts manager approves the run.
5. Each payslip is emailed, and appears in that employee's app at the same moment.
6. The six reports are run: employees, attendance, leaves, tasks, projects, reporting hierarchy.

ENDS WITH issued payslips, a payroll summary, and six reports for the month

G · Letters, change and exit

STARTS WHEN *somebody needs a document, or is leaving*

1. A letter is generated from live data — twelve types, from offer to termination.
2. Each carries a reference number and the company's own letterhead.
3. It appears in the employee's own Letters list, to open or share.
4. On resignation, status moves active → on_notice.
5. Open tasks are reassigned and assets are returned.
6. Relieving and experience letters are issued.
7. Status becomes exited, the login is deactivated and the session is revoked.

ENDS WITH a clean exit, with the record and the audit trail intact
