

HRMS Mobile Application

Proof of Concept

Whhoooh Path LLP · Android & iOS · Version 1.0 · 7 September 2026

1 What This System Does

It puts your entire HR operation on your employees' phones. A person opens the app, marks their attendance with their fingerprint, applies for leave, reads their payslip, downloads their offer letter, and messages HR — without a laptop, without a form, and without walking to anybody's desk.

HR and management get the other side of the same system: attendance for the whole company on any date, leave approved or refused in a tap with a written reason, payroll run for everyone in one action, letters issued on your letterhead in under a minute, and seven reports that export to Excel.

2 What It Replaces

How it is done today	How the app does it
A register at the gate, or a shared biometric machine everyone queues at. Disputes about who was in and when.	Each person punches on their own phone with their own fingerprint. A photo and a tamper-proof stamp are stored with every punch, so a record can be proven genuine later.
Leave asked for on WhatsApp or email. Balances tracked in a spreadsheet somebody has to remember to update.	Applied in the app against a live balance. The approver sees it the same minute and approves or refuses with a reason the employee reads on their own screen.
Payslips prepared and emailed one at a time.	Generated for the whole company in one action, on your letterhead, with a reference number. Each person opens their own on their phone.
Offer and experience letters retyped from an old file every time.	Issued from a standard template in under a minute, numbered, and permanently on record against that employee.
"Who has the spare laptop?"	An asset register showing every item, its serial number, and whose hands it is in.
No reliable answer to "how many were absent last month?"	Seven company reports — attendance, leave, payroll, tasks, projects, headcount, reporting lines — each downloadable as a spreadsheet.

3 Who Uses It

Everyone in the company signs in through the same app. What each person sees is decided by their role — there is no separate app to install and no separate login for managers.

Role	What they do in the app	Typical users
Employee	Mark attendance · apply for leave and see the decision · read payslips · download their letters · see their tasks, projects, assets and the company directory · message HR	Everybody

Role	What they do in the app	Typical users
HR Admin	Everything above, plus: add and manage people · approve or refuse leave · see the whole company's attendance for any date · run payroll · issue letters · publish policies · pull reports	The HR team
Management	Everything HR can do, plus: set the company profile that appears on every payslip and letter · approve the bank account salaries are paid from · see the company dashboard	Founder, Director

BEYOND THE THREE

The system also carries four narrower roles — Project Manager, Team Lead and Accounts Manager, plus a platform administrator for multi-company use. Each is a deliberately limited slice: an Accounts Manager, for instance, can approve the payout bank account but has no access at all to employee records. Full detail is in the companion manual.

4 How It Works

Why the attendance record can be trusted

Most attendance apps ask the phone "was that the right fingerprint?" and take the answer on trust — which means a tampered copy of the app can simply answer yes forever. This one does not work that way.

At each punch	What that gives you
The phone asks the server for a fresh, single-use code.	A punch can never be recorded twice, or recorded in advance.
The phone's own operating system demands the fingerprint or face before it will release the employee's private stamp.	Not the app's decision. The app cannot skip it, and neither can a modified copy of it.
The phone stamps that code and sends it back — together with a photo, if the camera is allowed.	The server checks the stamp against the one it registered for that person, so it knows the punch is genuinely theirs.

At each punch	What that gives you
Nothing biometric ever leaves the handset.	You hold attendance evidence without holding anybody's fingerprint — nothing sensitive to store, and nothing to lose.

Why access can be trusted

Buttons a person cannot use are hidden from them — but hiding a button is not security, and this system does not rely on it. Every request is checked again at the centre, where the records live, so an employee who somehow reached HR's screen would still be refused.

Kind of information	Who can see it
Your own attendance, leave, payslips and letters	You. And HR and management, for everybody.
Another employee's attendance or pay	HR and management only. Never a colleague.
PAN, Aadhaar and bank details	HR and management, and the employee's own. Held apart from the ordinary employee record so they cannot be read by accident.
Private messages between two people	Only those two. Nobody else in the company, at any level.
Company bank account for salary payments	Viewed by HR and finance. Approving it is a separate right, so the person who enters an account is never the person who signs it off.

5 A Day in the App

6 What Is Built and Working

This is not a mock-up. The application below is running, against a real database, with real roles and real permissions.

Area	What is in it
On the phone	Fingerprint attendance with photo · leave (apply and approve) · payslips · letters and certificates · people directory · tasks · projects · assets · policies · calendar · announcements · reporting lines · one-to-one messaging
In the portal	Everything above on a larger screen, plus payroll runs and salary structures · letter generation · recruitment pipeline · company bank details · seven reports with Excel export · departments, designations and company settings · audit log
Built in	Seven roles with separate permissions · your letterhead on every payslip and letter · Indian statutory fields (PF, ESI, PAN, TAN, GST) · works for more than one company on the same system

7 What Happens Next

Step	What is involved	Who does it
1. Company setup	Company name and address, departments, job titles — these appear on every payslip and letter.	Us, with your details
2. Load the people	Employees added with their roles, reporting lines and joining dates. Each gets a login.	Us, from your list
3. Pay setup	Salary structures, and the bank account salaries are paid from.	Your finance team
4. Roll out	Employees install the app, sign in, and set up fingerprint check-in once. Takes a minute each.	Your team, with our support
5. First payroll	Run for a full month and reconciled against your existing figures before you rely on it.	HR and finance, with us

WHAT YOU RECEIVE WITH THE APPLICATION

A 264-page user manual covering all seven roles and 72 screens, each with a screenshot placeholder, a block diagram and a step-by-step workflow.

Installation files for Android and iOS, and the web portal address.

This proof of concept, for circulation to anyone who needs the short version.
